Highly professional Software Developer with IT help desk and marketing experience. Being a creative problem solver with a passion for technology inspired the shift to focus on pursuing a full time career in the tech industry. Looking forward to the opportunity to leverage my creativity and technical skills to write clean and innovative code that will contribute to the continued growth and success of your company.

Technical Skills

HTML - CSS - Bootstrap - JavaScript - jQuery - Java SE - Java EE (Servlets, JSP) - Spring - MySQL - Thymeleaf - Object-Oriented Programming - Test-Driven Development - Version Control with Git - Paired Programming

Development Projects

CitySites
CitySites is for those looking for more to do in the great city of San Antonio and soon, a city near you! CitySites is a Full-Stack Web application that utilizes JavaScript, HTML, CSS, and Java with SpringBoot framework. Powered by Google APIs and the great minds of the CitySites development team, you, the user, will be able to find fun activities, save your favorite places, and even add your own activities. CitySites will show you where to go!

Movies Application
In this application, the user can visit the webpage to find several card components that include information about multiple movies. As my partner and I worked through this project, we provided options in order to manipulate the populated movies, as well as allow for the user to add their own movies to the webpage. During this project, several languages and resources were used, including CSS, HTML, jQuery, AJAX, and JavaScript, which provide the user with a unique experience alongside an aesthetically pleasing application.

Weather Map
In this solo project, an application was created to allow the user to visit a webpage designed to reveal the weather conditions of any given location. The user has the ability to locate any location via search box, or by moving a marker around a functional global map, in order to display the weather forecast for five consecutive days, including the current day. Several languages and resources were used in order to complete this project, including HTML, CSS, jQuery, AJAX, and OpenWeatherMap API.

Coffee Project
This webpage generates a list of coffees that can be manipulated by the user in several different ways. As my partner and I made progress through this joint project, the webpage was designed to give the user search and add capabilities, allow the user to identify a coffee of their choice or simply add the coffee they prefer. During this project, we decided to use CSS, HTML, and JavaScript in order to create the best experience for the user, as well as make the UI aesthetically pleasing.

Codeup Design Project
Created and designed a webpage for a fictional company that was responsive to any size of device, from as small as a cell phone to a large desktop monitor. During this joint project, my partner and I utilized CSS and HTML in order to create the best user experience, aesthetically and functionally.

Professional Experience
